Department of Obstetrics and Gynecology, Clinical hospital Osijek, Osijek, Croatia

We report a rare case of total placental abruption with consequential development of uteroplacental (Couvelaire uterus) and initial uteropelvic apoplexy in a multipara with unregulated arterial hypertension. Urgent cesarean section was performed to deliver a highly asphyxial male newborn. Considering the patient's multiparity and extent of apoplectic lesions, total hysterectomy without adnexa was done.
