

POST PARTUM EXAMINATIONS BY METHOD OF ELECTROPUNCTURE DIAGNOSTICS, AS AN IMPORTENT PART IN THE CARE OF PREGNANT WOMEN

Beridze N, Chkheidze A, Pirtsxalava T, Rekhviashvili M.

**National Center for the study of Pathophysiology of Pregnancy and Fetus, Outpatient
Department OGASH \"Caraps medline\". 5 Chavchavadze av. Tbilisi, Georgia**

By suggestions Secretariats General OG post partum examinations should take place two or three months after the delivery so that all changes due to pregnancy have disappeared. Post partum examinations by method of Electropuncture Diagnostic are mandatory and an extremly important part in the care of pregnant women by recomendation of World OGASH Board International Model Laboratory MPISRL.

The method of electroacupuncture, developed by Dr.Reinhold Fohle (E A F) is one of the most perspective trends of contemporary functional diagnostics. The method of EAF is currently used in 34 states of the world: in North and South Americas, Western and Eastern Europe states, Scandinavian countries, in India, China, Australia, etc. During more than 40 - year experience of clinical application of EAF R.Fohle and his followers have formulated the following possibilities of this method enabling to:

- determine functional condition of internal organs and tissue systems, conduct their functional and topic diagnostics, obtained due to the discovery of information-functional interconnections of biologically active zones (B A Z) and points (B A P) of skin with internal organs and tissue systems;
- decipher vague, clinically complex cases, conduct differential and synthetic diagnostics;
- conduct early diagnostics of various prepathological disturbances in organs, interconnected with BAP, and tissue systems at a preclinical stage of the progress of disease, when its symptoms are not expressed or present;
- reveal concealed or latent sources of infection and determine their effect on the immune reactivity of a human organism;
- conduct individual selection of homoeopathic, isopathic and allopathic preparations without their infusion into the human organism, i.e. \"from a distance\" and test food products, cosmetic products, dentotechnical and orthopaedic materials, etc.
- conduct monitoring of the efficiency of any method of treatment, evaluate the adequacy of its choice and application;

After the delivery to 120 patients, with various forms of pregnancy pathology, electropunctural diagnostic were made. They had various disturbances in organs and systems. We could correct or treat the discovered post partum condition and prevent EPH - Gestosis in 82% in the next pregnancy.

At the stage, our observations have showed that the standarts on Electropunctural Diagnostic of delivery (after two or three months after the delivery), who had EPH - Gestosis, shouldn't be, because each of the patient demonstrates individual departure from the norm, depending on the results, causing EPH - Gestosis (various extragenital pathology). Common tendencies were revealed but it should be better to check them on more observations.
